

One sheet is one complete set. A4 portrait, 250 gsm, single-sided — there are no backs in v2, print at **100%** — never “fit to page” · cut on the dotted line, where two ticks point at each other.

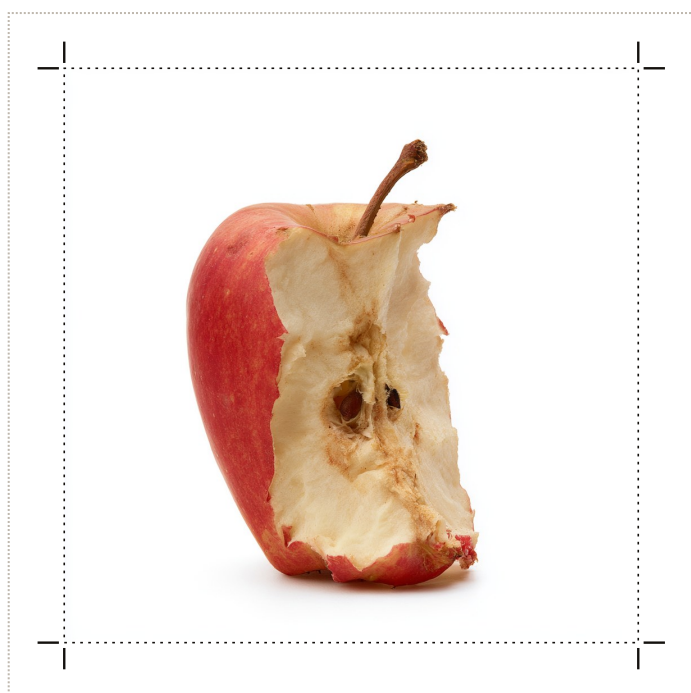

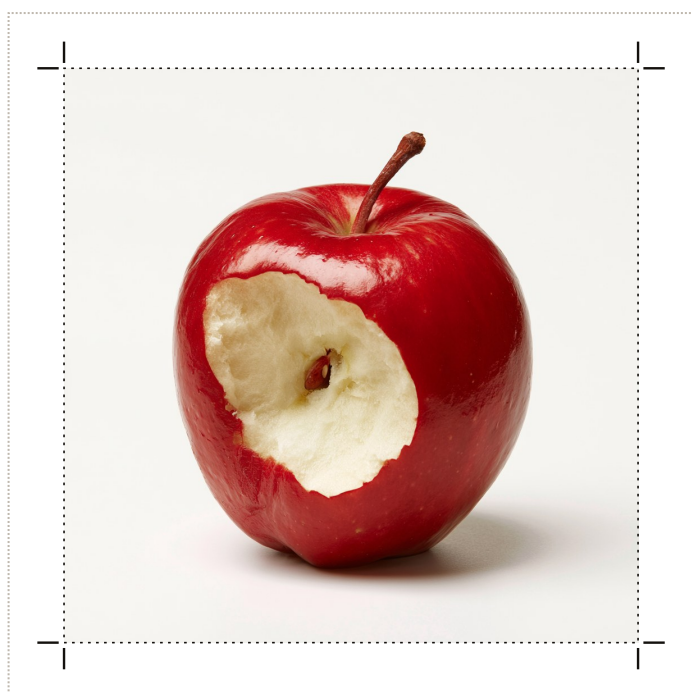

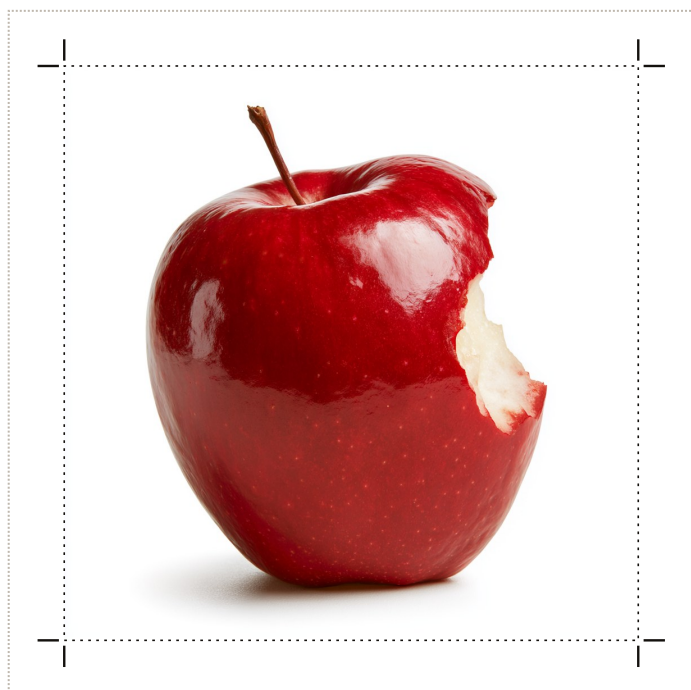

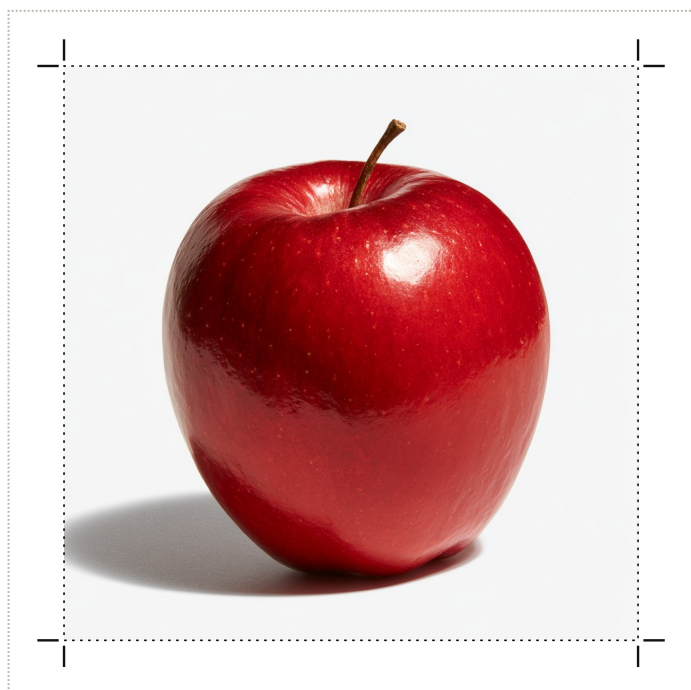

Nothing is printed on the picture face — no words, no numbers, no set letter. Laminate the sheet, cut the four 90 mm squares, and put them in their own envelope with **A** written on the envelope. The child orders them, then writes a line under each in the fold-book.

Photographed, and normalised as a set: the pot is the same width and stands on the same line in all four frames, so the only thing that changes between the cards is the plant. That is the whole content of the material.

Nothing is printed on the picture face — no words, no numbers, no set letter. Laminate the sheet, cut the four 90 mm squares, and put them in their own envelope with B written on the envelope. The child orders them, then writes a line under each in the fold-book.

Photographed, and normalised as a set: the frame, the light, and the distance are the same in all four pictures, so the only thing that changes between the cards is the bird's stage of growth. That is the whole content of the material.

Nothing is printed on the picture face — no words, no numbers, no set letter. Laminate the sheet, cut the four 90 mm squares, and put them in their own envelope with C written on the envelope. The child orders them, then writes a line under each in the fold-book.

Photographed, and normalised as a set: the apple is held at the same distance and angle in all four frames, so the only thing that changes between the cards is how much has been eaten. That is the whole content of the material.
