

Backup object cards. A printed stand-in for every miniature the shelf asks for — print the ones you could not buy and drop them in the basket beside the real objects. A 50 × 50 mm card sits in a child's hand about the way a 3–6 cm miniature does and stands up in a tray. Twenty-six cards in all, 15 here and 11 on sheet 2: cat ×3, pig ×3, hat ×3, dog ×2, sun ×2, mug ×2, bed ×2, and one each of pot, pan, tin, mop, peg, nut, bin, cot and kit. Seven of the objects are wanted by two or three trays at the same time, which is the only reason any of them is printed more than once.

One sheet of A4 landscape card, 300 gsm, single-sided — there is no duplex on this job. Print at 100% — never “fit to page”, which quietly turns a 50 mm card into a 48 mm one. Laminate the whole sheet first, then cut: 15 cards on the dotted rectangles, where two ticks point at each other. Matt laminate — gloss throws the ceiling lights straight back off a photograph.

No word is printed on any card, and that is not only the throw-away rule. These are sound-box objects: the child names the picture himself, and a word on the card would hand him the answer. Every word on this sheet is on the part you throw away.

Where they go. Tray 1 basket: pig · cat · sun · bed · mug · hat. Tray 2 Set A: cat · pig · dog · pot · pan · tin · mop · peg. Tray 2 Set B: hat · sun · mug · bed · nut · bin · cot · kit. Tray 8 oral game: cat · pig · hat · dog. All eight trays sit on the shelf at once, so an object that two trays both want is cut twice — the duplicates come off the sheet already stacked together.

Four objects are still waiting on a photograph. sun, pot, pan and tin have none yet, so their slots are drawn in amber dashes with the word written on them, and they carry no cut ticks because there is nothing to cut. That is five of the twenty-six pieces, because sun is wanted twice. The four Midjourney prompts are in scripts/curriculum/writing-shelf/MJ-PROMPTS-BACKUP-CARDS.md; when the pictures land in phonics-images/satpin-v2/cvc-photos/, rerun build_backup_object_cards.py and the slots fill themselves.

Same print as sheet 1: A4 landscape, 300 gsm card, single-sided, 100%, laminate the whole sheet and then cut. Eleven cards here.
